INTRODUCTION

- 1.1 Intent of Guidelines
- 1.2 Application of Guidelines
- 1.3 Guideline Overview
- 1.4 Standards & Compliance
- 1.5 Typography
- 1.6 Arrows & Pictograms
- 1.7 Colour Schedule
- 1.8 Sign Placement
- 1.9 Managing Visual Clutter
- 1.10 All Gender Washrooms

1.1 INTENT OF GUIDELINES

Signage within campus buildings and facilities is a critical means for users to navigate the campus, find, and identify destinations. Consistency in the design and application of all campus signs help a user's search by indicating what to look for while maintaining the integrity of the BCIT interior signage program and overall BCIT character.

This document provides specifications for how these signs are produced (including materiality, design, and messaging), located and installed to establish the look and feel of the interior signage system.

1.2 APPLICATION OF GUIDELINES

For all new build and renovation projects, interior sign location plans shall be accompanied by design intent drawings of all signage and wayfinding elements. This document shall be used to reference and maintain the integrity and consistency of all BCIT interior signage by keeping to the production and installation specifications for each sign type.

There will be circumstances that call for new or custom signage. In these cases, it is permitted to create a new or custom sign, provided the appearance, materiality, and fabrication of the sign adheres to the design language (colour, typography, dimensions, and other graphic elements) outlined in these guidelines. New or custom signage will need to be reviewed and approved by BCIT Campus Planning.

1.3 GUIDELINE OVERVIEW

Signage within this document is primarily for interior signage, and some exterior signs that would typically be mounted on a building. Identification, directional, information, and regulatory signage, are the main categories of Campus Interior signage that work together to function as a complete signage system.

It is the project manager's responsibility to engage an appropriate consultant to develop a comprehensive signage package, following this guideline and with input and approval from Campus Planning, Educational Support, SSEM and the BCIT Foundation.

Replacement or modification of any existing facility signs requires input and approval from Campus Planning.

For exterior signage within the public realm, refer to Master Sign Plan approved by the City of Burnaby.

1.4 STANDARDS & COMPLIANCE

Signage throughout BCIT must meet best practices for safety and accessibility. The primary standards documents are the BC Building Code and the Rick Hansen Foundation's Accessibility Certification. Links to these and other relevant standards resources may be found at the end of this document.

RICK HANSEN FOUNDATION STANDARD

The design specifications for colour, scale, material, placement and contrast outlined in this guideline are guided by the Rick Hansen Foundation standards for accessibility. All new signs laid out following this guideline must also refer to the RHFAC standard to ensure sign applications continue to meet high level of accessibility and inclusivity.

BC BUILDING CODE

All signage including Braille and raised lettering must meet the most current BC Building Code requirements.

1.5 TYPOGRAPHY

The primary font used for interior signage at BCIT is Trade Gothic LT Std. It can be obtained through Adobe Fonts, and other registered font providers.

Typically, interior signs are typeset in Trade Gothic LT Std-Bold No.2. This includes room names, destinations, directional information, regulatory information, etc. Room numbers are typeset in Trade Gothic LT Std-Bold. This is done because the numerical characters is more suitable to wayfinding in Trade Gothic LT Std-Bold. It is therefore important to ensure the right face is chosen for each application.

Some pictograms incorporate the Trade Gothic LT Std-Bold No.2 typeface in upper case. In these instances, the typeface is treated as a graphic component of the pictogram. Instances of secondary-level information uses Trade Gothic LT Std-Bold, such as the Wall-Mounted Building ID to communicate destination hierarchy.

There are to be no variations or substitutions permitted to this font.

BRAILLE AND TACTILE LETTERING

The interior sign system for BCIT follows the Braille Literacy Canada standard, and includes tactile lettering, icons and braille for added accessibility. The following standards should be observed across all applications of the guideline:

- a) Use grade 2 Braille.
- b) Braille strips should be a minimum of 10mm high.
- c) Spacing between Braille dots within a cell should be 2.5mm centre to centre; space between cells should be 3.75mm, and leading (vertical space) between lines should be 5mm.
- d) Tactile letters, Braille dots and icons should be raised minimum 1mm.
- e) Tactile letters and icons should have gently rounded edges and be produced by a 3D UV Printed process. The use of other fabrication methods, such as Gravotac, is discouraged.

1.6 ARROWS AND PICTOGRAMS

ARROWS

The arrow design for interior signs matches that of exterior signs. Arrows for interior signs conform to the arrow type used for external signs. It is not to be placed in a coloured square, and should be set in a high contrast colour to the background. On directional signs that point to more than one destination, the order of direction should be: up, up left/right, left, right, down left/right, down.

There are to be no variations or substitutions permitted to the graphic elements of the pictograms. However, different colours may be applied to backgrounds or pictograms themselves where appropriate.

PICTOGRAMS

All pictograms have been selected and/or created to conform to a universal and inclusive standards as much as possible, and to express a consistent visual style across all campus signage.

In most cases, pictograms appear as positive white graphics on Pantone 446C grey backgrounds. In select instances such as Regulatory or Parkade signs, pictograms may appear as positive white graphics on appropriate Pantone colour backgrounds or as Pantone coloured graphics on white backgrounds. Other Regulatory pictograms such as No Smoking and Do Not Enter, adhere to specific colours.

One pictogram is recommended per sign with the exception of multipurpose rooms that require additional pictograms to express clarity. List of pictograms approved for use on interior signs at BCIT can be found on page 7 of this document.

For additional resources on icons part of BCIT Health Safety and Environment, please refer to the latest Workplace Hazardous Materials Information System (WHMIS), published by WorkSafeBC: <https://www.worksafebc.com/en/health-safety/hazards-exposures/whmis>

1.7 COLOUR SCHEDULE

The colours for the sign system are specifically selected to enable uniform, recognizable and inclusive communication of wayfinding and information.

High contrast, and universality are two of the main principles guiding the colour choice. For that reason, strict adherence to these colour standards is expected in order to express consistency across all campus interior signage. There should be no variations or substitutions permitted to these elements.

The Pantone Matching System PMS colours below must match across all applications: paint, vinyl, and digital outputs.

1.8 SIGN PLACEMENT

Determining appropriate placement for a sign will depend on its intended purpose, the context of the built environment, and the presence of other related signs. In general signs must be clearly visible from anywhere in the vicinity of their installation such that they are not hidden from view by architectural features, freestanding furniture or equipment, or other signs. In turn, when installing a new sign, it is important to consider its effect on sign-lines to other features within the space and the collective volume of visual information it creates. See the following section, *1.9 Managing Visual Clutter* for more information.

Different sign types will have varying criteria for their placement. The following points provide general notes for placing each sign type:

IDENTIFICATION SIGNS

Identification signage must be placed at the location of the destination or amenity to which it refers. The most important consideration for placement of identification signs is that they are consistent in their relation to the location they identify. When multiple identification signs of different types are used every effort should be made to ensure they are aligned with one another.

DIRECTIONAL SIGNS

The placement of directional signs is determined by the path a user is expected to follow to reach a destination. An ideal route will consist of a series of directional queues provided at key decision points along this route. Choosing these points strategically is important. Typically a user should encounter directional information either where a decision has been reached but the destination is not yet visible, or shortly after moving out of sight from the previous queue in their journey. If multiple directional signs pointing to the same location are visible from a single location signage should be reduced; if no queues are visible at a decision point, it may need to be increased.

INFORMATION, REGULATORY, & PARKING SIGNS

The collective purpose of these signs is to convey contextual information about the built environment. Appropriate placement of these signs must ensure that the context to which the sign applies is readily apparent. Eg: A parking sign referring to the operation of payment kiosk should be placed immediately on or adjacent to the equipment to which it refers. In information heavy environments it is very easy for these sign-types to be over used. In such cases, refer to the strategies for *Reducing Visual Clutter* on the following pages

INTERPRETIVE SIGNS

Interpretive signs vary in purpose, but typically convey narrative information intended to enhance a space. Because of this, interpretive signage is best separated from purely functional signs and located in open areas. This separation both allows the interpretive information to be better appreciated, and ensures that individuals stopping to access the information will not conflict with others moving through the space. Where appreciation of a view or object is the focus of the sign, it should be located to provide a good vantage point while allowing users to read the sign without blocking sight lines or interfering with others using the space.

1.9 MANAGING VISUAL CLUTTER

Visual clutter refers to the complexity of visual information present in a given environment. A natural response to high levels of visual clutter is to filter out irrelevant details. As clutter increases the likelihood of information being subconsciously ignored will correspondingly increase. In the context of built environments this means it is important to understand how visual clutter works and take steps to minimize it wherever possible.

FACTORS EFFECTING VISUAL CLUTTER

Understanding factors that influence visual clutter is critical when adding signs to a built environment. Minimizing these factors and mitigating their effects will increase the effectiveness of the sign program as a whole.

QUANTITY: The number of signs in a space is the most direct factor increasing clutter. Adding more signs contributes to crowding, which overloads the user's cognitive capacity to absorb information; and occlusion, where free-standing, suspended, and projecting signs will begin to block sight lines to other information.

ORGANIZATION: Positioning can significantly impact a user's ability to process information. Signs mounted at irregular heights or orientations are can be irritating to process and cause confusion about where to look for information.

COLOUR: While colour can be an incredibly useful tool for drawing attention, it significantly increases the visual complexity of a space. This may have the effect of reducing the visibility of other information. Competing uses of colour greatly increase the effort required to absorb information and make decisions in a built environment.

OUTLINE: The ability to determine the boundary of an object allows users to deal with the environment as a series of discrete objects. Complex, organic outlines tend to increase visual clutter.

REDUCING VISUAL CLUTTER

Minimizing visual clutter is a matter of managing how information is presented in an environment. In situations where multiple signs must exist together the following strategies can reduce the number of signs required and allow for more efficient assimilation of important information.

When considering directional signage, use as few signs as possible to support a user's effective movement through the space. Avoid creating situations where multiple instances of the same wayfinding information is visible from a single decision point. This may mean supporting only one of several similar routes to a destination, favouring simplicity over comprehensive information.

Make use of levels of hierarchy to differentiate information. Where signs necessarily occur in multiples, such as room numbers in a hallway, ensure consistent position and alignment. Small deviations such as inconsistent mounting height or distance from a door frame will make the task of locating any particular piece of information more difficult.

If there is an opportunity to consolidate multiple signs into a single one, this should be done to reduce the number of individual signs in a space and collect related information in a single spot. Several signs in the document have multiple size options to allow for this.

Prioritize context specific information above general information. Particularly in information dense environments, consider removing general regulatory or information signs to ensure that immediate life-safety or mandatory action signs are clearly displayed.

Visual clutter is a natural product of evolving communication needs over time. The only way to manage visual clutter is to regularly reassess the communication needs in a space and streamline them wherever possible.

IDENTIFICATION

2.0 IDENTIFICATION OVERVIEW

Identification signage is used to mark the specific location of features and destinations within the built environment. It is critical to the function of these signs that they are placed within close proximity and positioned with a consistent relationship to the location they identify. Refer to individual sign type descriptions for specific placement standards.

8.0 References

Intended Usage

Base Building signs support and identify building facilities, amenities, and internal circulation routes using white pictograms and/or text on Pantone 446C grey backgrounds, with the exception of safety signage. Base Building signs are used when a destination or amenity, such as a washroom or stairwell is not visible down a long corridor, or when greater visual presence is required. They are twice as large as their wall mounted counterparts, double sided, and project out perpendicular to the wall above door height so they can be seen from a distance.

Messaging

TBD

Specification

SIZE

- 300mm x 300mm

PRODUCTION

- 6mm thick aluminum panel painted all sides to match Pantone 446C grey or Pantone 485C red or Pantone 3415C green.
- Edges and corners eased
- Copy / symbol applied as cut white vinyl.

INSTALLATION

- Sign mounted 90° to wall with 2 / 25mm x 25mm aluminum angle brackets painted MP33172 LRV57
- Mounting hardware tamper proof, inset and painted to match.
- Bottom of sign mounted at 2134mm min - 3048mm max above finished floor.
- Blocking may be required for wall mounting to ensure sign is level and secure.

Intended Usage

Building Maintenance signs are used exclusively to identify rooms such as electrical, communications, mechanical, elevator closet, storage, janitors rooms or other non-public service rooms. These signs are wall mounted on the latch side of the door. Where there is no door, installation is typically on the left side (facing the entrance).

Messaging

Room identification text shall be consistent with similar facilities. For unique or ambiguous cases arise refer to architectural plans for room identification text and confirm messaging with campus planning prior to production and installation.

Specification

SIZE

- ▶ 152mm x 152mm

PRODUCTION

- ▶ 3mm thick acrylic sign painted all sides to match Pantone 446 C grey.
- ▶ Copy/icon white 3D UV digitally printed, 1/32"
- ▶ Raster clear bead Braille.

INSTALLATION

- ▶ Signs mounted with VHB tape.
- ▶ Mount 100mm next to door on latch side.
- ▶ Align top of panel to 1450mm from ground. If there is no door, install on left side of entrance.

BUILDING ID PYLON

1.0 Introduction

2.0 Identification

3.0 Directional

4.0 Information

5.0 Regulatory

6.0 Parking

7.0 Interpretive

8.0 References

Intended Usage

The Building ID pylon identifies a primary building entrance for pedestrian users and is to be located in close proximity to the primary building entrance. This sign is the preferred option for building ID signage, however if space does not allow for its use, refer to the Building ID Panel (2.12). Only one sign may be used per building unless a large building has multiple main entry points. Final location to be determined in consultation with Campus Planning.

Messaging

TBD

Specification

SIZE

- 716mm x 1,360mm

PRODUCTION

- ***CONTENT TBD***

INSTALLATION

- Sign is to be oriented parallel to the building facade and adjacent street-scape.
- The Building ID Pylon requires a concrete base engineered to suit the proposed location.
- Exposed concrete to be sanded smooth with edges eased and sealed.

5.0 Regulatory

6.0 Parking

7.0 Interpretive

8.0 References

Intended Usage

The Building ID Panel is to be used only when the Building ID Pylon (2.11) is not feasible. The Building ID Panel is a wall-mounted sign on the exterior of building main entrances, indicating building name and the main amenities within. These signs are intended for pedestrians, and may be mounted on wall or glazing. Reference sign type B2 of the BCIT Master Sign Plan.

Messaging

TBD

Specification

SIZE

- 762mm x 762mm

PRODUCTION

- 3mm non-directional fine grained horizontal brushed aluminum panel.
- Building number and blue field and destinations direct printed vinyl with anti graffiti UV film.

INSTALLATION

- If mounted on glazing, sign to be mounted with VHB tape. Subsurface vinyl glass backer applied on second surface; Avery Medium Gray #835.
- If mounted on wall or building facade, mount sign on 1" aluminum frame inset 1" from all edges. Mount frame to building wall. Fabricator to recommend best mounting method based on facade finish.
- If mounted on uneven finish, sign frame needs to be adjusted such that the sign sits flat, even and true to the wall.
- Top of sign mounted at 1800mm from ground on left side of entrance if possible.
- No visible hardware on the sign face.

8.0 References

Intended Usage

This sign type should be located at the primary building entrance and be scaled to be viewed from the nearest campus streetscape facing the primary entrance. Signage is to be scaled to be legible for both pedestrians and vehicles with maximum speed of 30km/hr. The Primary Building Name must be dimensional letters either mounted to the building or a landscape monument. Letters can be either raised or recessed using durable and suitable materials such as stainless steel, aluminum, cast-in-place concrete or other materials designed to compliment the architecture. .

Reference sign type B3 of the BCIT Master Sign Plan.

Messaging

One sign is permitted for each building. The design is to complement and be integrated into the building's architecture and available real estate. This sign is to use minimum 15mm to maximum 300mm tall dimensional letter, and aligned respectively to the building's architecture. Shorter building names with one line of text are preferred. Longer names with two lines of text will be considered on a case-by-case basis in consultation with Campus Planning. Letter height will remain at maximum 300mm tall per line and overall height should not exceed 660mm.

Specification

SIZE

- ▶ Recommended letter height is between 150mm and 225mm for internal BCIT facing streetscapes and up to 300mm for external City of Burnaby facing streetscapes where visibility and space allows.
- ▶ Maximum letter height 300mm

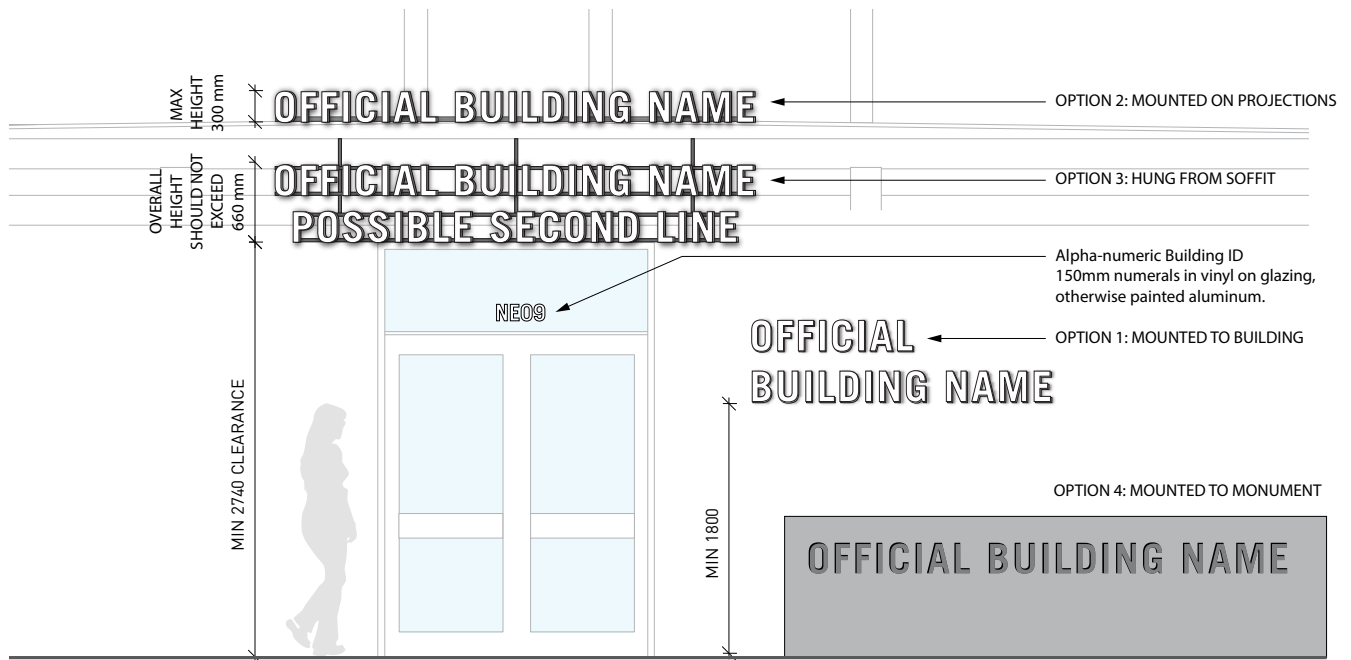

PRODUCTION

- ▶ Letters must be made of stainless steel, thickness between 4.5mm and 6mm. Letters finish/paint to match architecture.

INSTALLATION

There are four location options for this sign:

- ▶ (1) mounted to the building wall or facade;
- ▶ (2) mounted on projections such as a canopy;
- ▶ (3) mounted under a soffit or projection such as a canopy.
- ▶ (4) installed on a landscape monument.
- ▶ Installation method to be recommended by fabricator or installer to best suit location.
- ▶ For overhanging signs a minimum clearance of 2740mm from grade below is required.

TYPICAL DESIGN AND LOCATION OPTIONS

SECONDARY BUILDING IDENTIFICATION

1.0 Introduction

2.0 Identification

3.0 Directional

4.0 Information

5.0 Regulatory

7.0 Interpretive

8.0 References

Intended Usage

These signs are to be located at all secondary building entrances, where applicable. There are three location options for this sign, in order of preference, (1) on the wall of facade next to the entry doors; (2) on the glazing next to the entry doors; (3) on the entry doors. If the sign is mounted to a wall of facade, it must be dimensional, if on glazing it must be vinyl. Mounting method for dimensional letters is to be determined by the fabricator/installer in consideration with the architecture conditions. This sign is inward facing, identifies the building name at a secondary entrance, and offers donor recognition opportunities, if applicable. Reference sign type B4 of the BCIT Exterior Master Sign Plan. Reference sign type B4 of the BCIT Master Sign Plan.

Messaging

TBD

Specification

SIZE

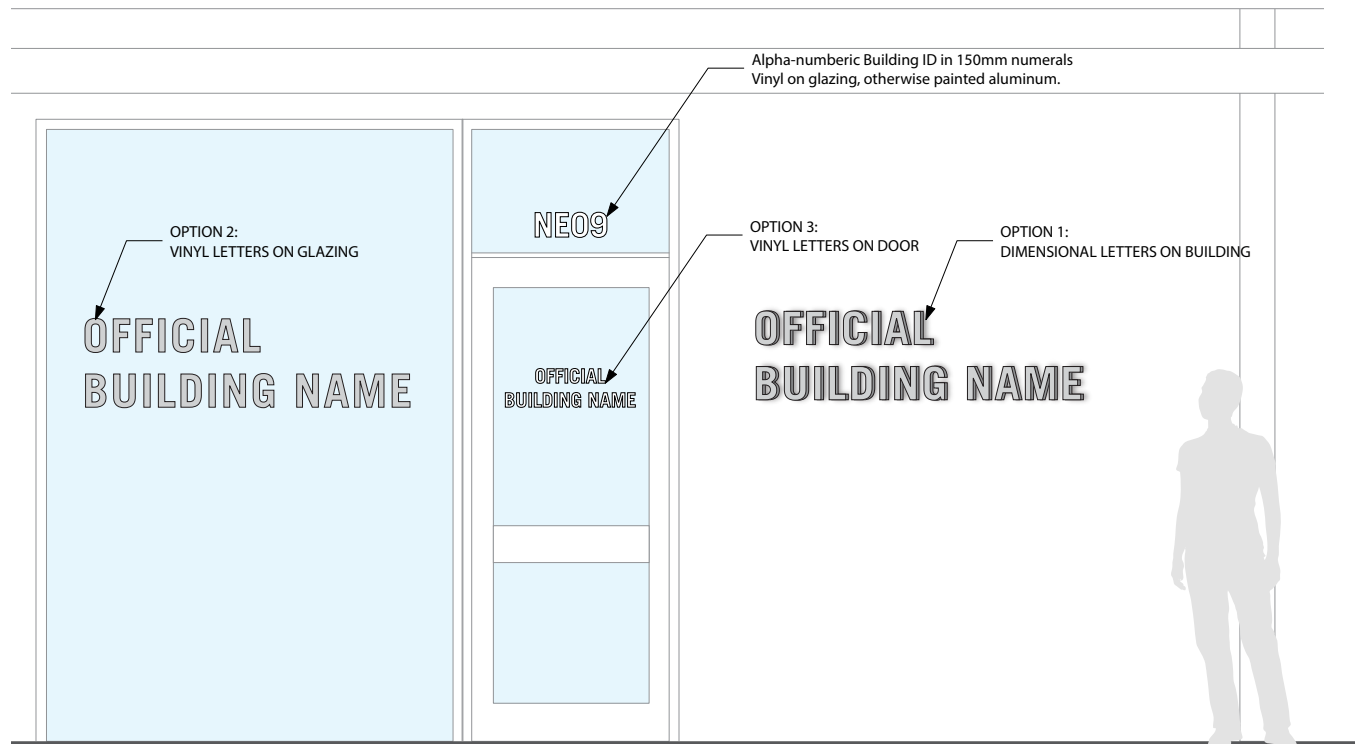

- Letter height varies based on location and name length. Minimum 4in to maximum 6in letter height.

PRODUCTION

- If applied on glazing or door, use exterior grade white vinyl.
- If applied on wall of facade, letters must be made of stainless steel or painted aluminum, thickness between 4.5mm and 6mm. Letters finish/paint to match architecture.

INSTALLATION

- Mounting method to be recommended by fabricator or installer to best suit substrate.
- Minimum clearance from sign base to finished grade is 1800mm.

- 3.3 Small Building Directory
- 3.4 Large Building Directory
- 3.5 Interior Directory Pylon

DIRECTIONAL

3.0 DIRECTIONAL OVERVIEW

Directional signs provide wayfinding information to solve users' navigational problems. Strategically placed throughout campus buildings and working in tandem, Directories, Wall Directional signs, and Suspended Directional signs guide users to multiple destinations in the most direct way possible.

When all three sign types are used together, a navigational hierarchy can be created providing a wayfinding logic users can then follow. Directories should be placed so they are visible at floor entry points. The listings on the Directory should be included on nearby Directional signage, whether wall-mounted or ceiling suspended, to indicate the route forward for the visitor.

- ▶ Gray strips on left and right direct printed to match Pantone 446C grey
- ▶ Text applied as black vinyl; arrows applied as white vinyl

INSTALLATION

- ▶ Signs mounted to wall with a 1/2" backer panel inset 1/2" from acrylic faceplate on all sides.
- ▶ Can be mounted with VHB tape or Z-clip bracket. Mounting bracket to be designed by sign fabricator in order to suit wall conditions.
- ▶ Mounted 1500mm on centre

SUSPENDED DIRECTIONAL

1.0 Introduction

2.0 Identification

3.0 Directional

4.0 Information

5.0 Regulatory

6.0 Parking

7.0 Interpretive

8.0 References

Intended Usage

Suspended Directional signs provide wayfinding information for users as they navigate their way toward their destination. These signs work well in spacious areas like entrances, at the end of long hallways, and foot traffic intersections where both sides of the sign can be utilized to inform two directions of foot traffic. This is because they are larger than wall mounted directories and can therefore be read from a greater distance. These signs are ceiling mounted and so also work well where there is no logical wall surface and there is enough ceiling height to allow clearance.

Messaging

TBD

Specification

SIZE

- 1270mm x 356mm

PRODUCTION

- w/ 90° edges.
- 3mm acrylic faceplates, permanently flush mounted to each side of a PVC core.
- Acrylic is painted silver MP33172 LRV57.
- 6mm PVC Core to be black and recessed 6mm from outer edge of acrylic faceplates.
- Dark grey fields direct printed on sides, matching Pantone 446C grey.
- Arrows applied in white vinyl to dark grey fields. Text and icons applied in black vinyl to acrylic faceplates.

INSTALLATION

- Plaques suspended from ceiling conditions w/ stainless steel cable and satin-brushed aluminum mounting hardware inset into PVC core, between acrylic faceplates. Mounting hardware must be hidden inside the sign. Cables must be perfectly perpendicular to the sign, straight and true. Ceiling hardware must be concealed and void of loose hardware.
- Ceiling mounted, bottom of sign at 2286mm min and 2743mm max from finished floor

Intended Usage

The PPE Requirement notice informs users of the protective equipment required to enter a space. This is to be prominently placed at primary access points to all areas requiring PPE. The aim of this sign is to summarize all PPE requirements on a single sign; remove redundant signage when this is installed. Detailed descriptions of PPE policies or proper usage may be displayed within the space, but must not be added at entrances.

Messaging

Select the panel size appropriate to the number of PPE items required. Maintain the indicated icon spacing and placement. Fill the sign from left to right and top to bottom. If the full capacity of the sign is not used leave the remaining spaces blank.

8.0 References

Intended Usage

These signs to be used for health and safety and environment signage as required. They are intended to identify equipment or safety information specific to the location where they are displayed.

Messaging

Select the colour and heading option appropriate to the required message. DO NOT alter heading text or colour (eg: "Notice" signs may not use a yellow or red background).

The primary messaging text may be resized to accommodate longer words or a short phrase, but is not intended to display full sentences. Secondary messaging may be added along the bottom of the sign to provide additional directive or contextual information.

All messaging to be approved by SSEM and Campus Planning before production.

Specification

SIZE

- 220mm x 185mm

FABRICATION

- 3mm white acrylic w/ 90° edges corners eased.
- Graphics direct printed onto white acrylic.

INSTALLATION

- Mount with VHB tape.
- Consider alignment with existing equipment or signage in the area. If align top edge to 1500mm from floor.
- Subsurface vinyl glass backer applied if mounted on sidelight, use Avery Medium Gray #835.

SIDE A - TYPICAL

EXAMPLE APPLICATIONS

SUGGESTED TYPE-SIZES FOR MESSAGING

MAXIMUM 140pt
Single line, one or two words

INTERMEDIATE 110pt
Double line, one or two words per line

SMALL 110pt
Up to three lines, two to four words per line

SENTENCE 30pt
Single sentence of up to three lines.

REGULATORY

5.0 REGULATORY OVERVIEW

Regulatory signage provides users with information and is also focused on safety, rather than wayfinding. It can be used to reinforce rules, set safety standards, establish privacy expectations, and provide operational information.

Regulatory signage is available in various formats for different applications.

1.0 Introduction

2.0 Identification

3.0 Directional

Parkade signage supports vehicular and foot traffic within campus building or facility parkades. Highly visible and straightforward wayfinding information is essential for a campus to be safe, comfortable, and functional. This is especially true within a parkade setting. To ease disorientation and anxiety, parkade wayfinding relies on signage with bright colours and high contrast. The recommended parkade level colours are listed below, along with an example of the sign types applied in yellow, as they would be on Level 1.

The Parkade signage family is comprised of Identification and Directional type signs specific to Parkade spaces.

Parkade Colours

Pantone 137 C
Gold
(Parkade Level 1)

Pantone 248 C

5.0 Regulatory

6.0 Parking

7.0 Interpretive

8.0 References

Intended Usage

Parking entrance signs indicate to drivers the entry ramp to parking locations that are within buildings. These signs are large, and can be made and mounted in one of two options: double sided, projecting from a building perpendicular to the entry into parkades; or single sided mounted on building facade at/adjacent to the parkade entrance. Sign may be internally illuminated.

Reference the BCIT Sign Master Plan for additional detail on placement parameters.

Messaging

Intended Usage

Overhead signs operate as Suspended Directional signs for vehicular traffic in parkades. Ceiling mount these signs in order to guide vehicles along circulation routes in parkades.

Messaging

TBD

Specification

SIZE

- 229mm x 2442mm overall

PRODUCTION

- 3mm thick aluminum panel with 90° edges
- Paint to match Pantone 446C grey (sign is painted to match Pantone 1795C for do not enter signs)
- Surface applied white vinyl copy and symbols
- Surface applied vinyl colour blocks to match designated level colours
- 47mm diameter anodized aluminum tube and 6mm thick aluminum end caps

INSTALLATION

- Signs are suspended from ceiling conditions with concealed stainless steel cable and satin-brushed aluminum mounting hardware.
- Ceiling mounted min 2430mm from bottom of sign to finished floor.

WALL MOUNTED DIRECTIONAL SIGN

1.0 Introduction

2.0 Identification

3.0 Directional

4.0 Information

5.0 Regulatory

6.0 Parking

7.0 Interpretive

8.0 References

Intended Usage

Parkade Wall graphics utilize oversized pictograms to serve as beacons and directional signs to lead users (on foot) to access points including elevators, stairs, and pay machines.

Graphic elements are combined to accommodate specific site conditions and layouts. Use of standard pictograms and colours will ensure a consistent visual language across all campus parkades even though each site configuration may be different. The arrangement of graphic elements and arrows is to be strategic such that wayfinding directions are clear but not too cluttered. Icons must be placed It is recommended that exterior vestibule walls are fully painted in the level colour, and the band with arrows and icons is used sparingly.

Walls are painted in the appropriate colour first with white cut vinyl decals applied on top of the painted wall colour.

Messaging
